Propagation and geometry
LOS / ground / wall / NLOS
Wavelength and baseline vectors
Relative complex fields
Measurement formation
Antenna voltage response
Channel-specific level and bias
Correlated noise → quantization
Observable differences
Spatial or L1–L5 samples
Calibration before differencing
Shared reference channel
E1–E2: physical checks
Phase convention and null cases
Baseline orientation and length
Exact vs weak-signal response
E3 and E5: empirical tests
Paired train/test scenes; five seeds
Equal-channel layout controls
Bias, calibration and scene shifts
E4: binary detection limit
Phase-marginalized discrete PMFs
Equal-prior Bayes error
Explicit nuisance assumptions
